CTP JOB CARDS SYSTEM

Employee Guide

Onboarding, Job Card Workflow & Notifications

For: Operators · Technicians | Version 1.0 | 2026

1 Onboarding & App Permissions

Who Uses This App

There are four types of users in the CTP Job Cards system:

OPERATOR

Reports faults and creates job cards when a machine or process has an issue.

TECHNICIAN

Receives job notifications, attends to faults, and closes jobs when resolved.

MANAGER

Oversees job cards in their department and ensures quality of records.

ADMIN

Manages system, employee accounts, and configuration.

> ℹ️ **Operators and Technicians are separate roles.** An operator is the person who discovers and reports the fault. A technician is the person who goes to fix it.

Logging In

You log in using your **company email address** and **password**. Your account is linked to your clock number, which determines your role, your department, and what you see in the app.

If you have forgotten your password, tap "*Forgot Password*" on the login screen and a reset link will be sent to your email.

First-Time Setup: App Permissions

When you open the app for the first time, it will ask for several permissions. Each one is required for the app to work correctly. **Do not skip or deny these.**

1 Location — "Allow All the Time"

App asks: "Allow CTP Job Cards to access your location all the time."

The app uses your location to determine whether you are on site or off site. Only on-site technicians receive job card notifications. When you enter or leave the company boundary, the system logs it automatically and your on-site status updates in real time.

Location is not used for surveillance. It is used solely to determine whether you are within the company boundary.

✓ Select "Allow All the Time" — choosing "Only While Using the App" will break background geofencing.

2 Notifications — "Allow"

App asks: "Allow CTP Job Cards to send you notifications."

Every job card alert, escalation, and urgent fault reaches you through notifications. Without this permission you will receive nothing — the system will escalate jobs as if no one is responding.

✓ Always select "Allow."

3 Battery Optimisation — "Unrestricted"

App asks: "Allow CTP Job Cards to run in the background without restrictions."

Android phones aggressively shut down background apps to save battery. If the app is "optimised," your phone may kill it after a few minutes, causing you to miss notifications entirely — especially overnight.

✓ Go to Settings → Apps → CTP Job Cards → Battery → Unrestricted.

4 Display Over Other Apps

App asks: "Allow CTP Job Cards to appear over other apps."

Priority 5 faults — production is standing — require a full-screen alert that appears even if your phone is locked or another app is open. This permission makes that possible.

✓ Grant this permission. Without it, P5 alerts fall back to a standard banner, which is easily missed.

5 Do Not Disturb Access

App asks: "Allow CTP Job Cards to override Do Not Disturb."

If your phone is in Do Not Disturb mode, standard notifications are silenced. This permission allows P5 critical alarms to bypass DND so the alarm still sounds when production is standing.

✓ Grant this permission for full P5 coverage.

6 Schedule Exact Alarms

App asks: "Allow CTP Job Cards to set exact alarms."

The P5 full-screen alarm uses the phone's alarm system to guarantee it fires at exactly the right moment, even in deep sleep mode. Without this, the alarm may arrive late or not at all.

✓ Grant when prompted. On some phones: Settings → Apps → Special App Access → Alarms & Reminders.

2 Flow of Job Cards

What is a Job Card?

A job card is a formal digital record of a fault, breakdown, or maintenance task. It captures the department, area, machine, component, fault description, priority, and type (Mechanical / Electrical / Mech-Elec). It is the system's source of truth for every fault on site.

Priority Levels

Priority reflects the real production impact at the time the fault is reported:

PRIORITY	PRODUCTION IMPACT	EXPECTED RESPONSE
P1	No effect on production — routine or planned work	Attend when available
P2	Minor impact — production continuing	Attend soon
P3	Moderate impact — degraded operation	Attend within the shift
P4	Significant impact — output reduced	Attend as soon as possible
P5	**Production is standing — stopped**	**Immediate response**

⚠️ **Priority must be honest.** A P5 means production has stopped. Using P5 routinely when production is running erodes the system's ability to distinguish genuine emergencies. Managers monitor priority accuracy.

Job Card Status

STATUS	MEANING
Open	Job is live — awaiting or being worked by a technician
Monitor	Fault resolved but machine is being watched for recurrence
Closed	Job complete and confirmed resolved

For Operators: Creating a Job Card

When you discover a fault or breakdown, create a job card immediately. Do not wait.

1. Open the CTP Job Cards app
2. Tap **Create Job Card**
3. Fill in *all* fields — department, area, machine, part, description, and priority
4. Submit — the relevant technicians are notified instantly

WHAT GOOD LOOKS LIKE

INSTEAD OF...	WRITE...
"Machine broken"	"Conveyor 3 drive motor tripping on overload — production line stopped"
"Pump issue"	"Cooling water pump P-02 not priming — no flow to chiller circuit"
"Fault on line"	"PLC fault code E-14 on Line 2 pressing machine — cycle will not complete"

Once submitted, you can track the job's status in the app. You will receive a notification when a technician accepts the job and again when it is closed.

For Technicians: Receiving and Working a Job

STEP 1 — RECEIVE THE NOTIFICATION

When a job matching your trade is created and you are on site, you receive a push notification showing the job number, priority, machine, area, and description. You have three options directly from the notification:

ACTION	WHAT IT DOES
Assign Self	You take ownership of the job. The operator is notified. Escalation stops immediately.
I'm Busy	You acknowledge the job but cannot attend right now. The operator is notified. Escalation stops. The system continues looking for another technician.
Dismiss	You dismiss the alert. This is logged. Escalation continues until someone accepts.

Assign Self | I'm Busy | Dismiss

Always respond to notifications. If you do not respond, the system escalates the job to your foreman and then your manager. All responses — or lack thereof — are visible in the notification log.

STEP 2 — WORK THE JOB

Once accepted, navigate to **My Assigned Jobs** in the app to view full details. Update the status as you progress. When the fault is resolved but you want to monitor the machine, set it to **Monitor**. When the job is fully complete, set it to **Closed**.

STEP 3 — CLOSE THE JOB

When closing a job you must add a note. A closed job with no note is an incomplete record. Include:

- **What was done** — the actual repair or action taken
- **Parts used** — including numbers or specifications where possible
- **Root cause** — wear, contamination, operator error, age, incorrect adjustment?
- **Recommendations** — any follow-up work or scheduled maintenance needed

The operator who raised the job is automatically notified when you close it.

Automatic Escalation: What Happens If Nobody Responds?

TIME AFTER JOB CREATION	WHAT HAPPENS
2 minutes	Foremen and on-site managers for the relevant department are notified
7 minutes	Department managers and the workshop manager receive an urgent alert
30 minutes	Further escalation as configured

Escalation stops the moment any technician assigns themselves or responds "I'm Busy."

3 Notifications — Types & What They Mean

PRIORITY 1 · 2 · 3

NORMAL BANNER

Appearance	Standard Android notification banner at the top of the screen
Sound	Default notification tone
Behaviour	Appears and disappears. Tap to open the job.
Used for	Jobs that need attention but are not stopping production

PRIORITY 4

PERSISTENT BANNER

Appearance	Notification that stays in your panel until acted upon. Cannot be swiped away.
Sound	Escalation alert tone with strong vibration pattern
Behaviour	Remains visible until you tap an action button: Assign Self, Busy, or Dismiss
Used for	Significant production impact — prompt response required

PRIORITY 5 — CRITICAL

FULL-SCREEN ALARM

Appearance	Full-screen alert that takes over the entire phone, even from the lock screen
Sound	Loud, repeating alarm — bypasses Do Not Disturb
Behaviour	Cannot be passively ignored. Tapping any action button dismisses the alarm and logs your response.

Used for	**Production is standing. Immediate response required.**

Notification Action Buttons

BUTTON	EFFECT
Assign Self	Assigns the job to you, notifies the operator, stops escalation
I'm Busy	Logs your response, notifies the operator, stops escalation — system continues looking for another technician
Dismiss	Logs a dismissed response. Escalation continues until someone accepts.

On-Site Arrival & Departure Notifications

When you cross the company boundary you automatically receive:

- **"Arrived On-Site"** — your status updates and job notifications begin
- **"Left Site Area"** — your status updates and job notifications pause until you return

This is fully automatic — no action required from you.

The Future: AI-Assisted Maintenance

Predictive Maintenance

By analysing the history of job cards — which machines fail most often, at what intervals, under what conditions — the system will generate predictive alerts:

- "Machine X has had 4 bearing failures in 6 months. Inspection recommended within 3 weeks."
- "Fault frequency on Line 3 increases in summer. Pre-emptive service advised."

This shifts the team from reacting to breakdowns to planning interventions during scheduled downtime.

AI Chatbot — Manuals & Fault Finding

A conversational AI assistant will be integrated into the app with access to operator manuals, historical fault records, wiring diagrams, and parts lists. A technician on the floor will be able to ask:

> *"The conveyor on Line 2 is tripping on overload. What are the common causes?"*

> *"What is the torque spec for the main shaft bearing on the FX400 gearbox?"*

> *"What was done the last time this fault appeared on Machine 7?"*

The assistant responds instantly with answers drawn from official documentation and real maintenance history.

> **Your job card entries today become the data that makes these AI tools accurate.** Complete descriptions and clear closure notes are an investment in the system's future intelligence.
