

CHANGELOG

CTP Job Cards — Documentation Changelog

Append-only log of user-visible changes. Add a new entry at the top each release; do not edit historical entries except to fix factual errors.

The role guides, the onboarding flow, and the reference docs all draw from this log. Whatever you write here is what staff will read next time they open the docs portal.

2026-05-18 — Documentation portal, role-aware onboarding, accuracy pass

New for users

- **One docs portal** — `docs/index.html` is the single entry point. Sidebar nav links to every guide (employee, manager, executive, app features, escalation, screens, troubleshooting). Open it in any browser.
- **Role-aware onboarding** — first-login carousel now branches on your role (Technician / Manager / Operator / Admin). The shared pages on P1–P5 priorities, escalation, and permissions stay the same for everyone — that's the part everyone needs to know.
- **P1–P5 explained explicitly** — onboarding now shows all five priority levels with the exact notification behaviour (banner / persistent / full-screen alarm) tied to each.
- **4-stage escalation diagram** — onboarding includes a stage-by-stage walkthrough with the actual defaults (5 / 10 min enabled; 30 / 60 min disabled, configurable by Admin).

New for admins

- **Three new docs** —
 - [Cloud Functions deployment guide](#) — function inventory, two-region layout (`africa-south1` + `eu-west1`), deployment commands, common failure modes.

- [Troubleshooting & FAQ](#) — symptom-driven fixes for notifications, geofence, sync, login, and escalation.
- [Firebase security rules guide](#) — what `storage.rules` enforces, what Firestore rules *should* enforce, action items for tightening.

Documentation toolchain

- **Markdown is now the single source of truth.** Every doc lives as `.md` first; HTML and PDF are generated by `tools/build-docs.ps1`. To update a guide: edit the `.md`, run the script, commit all three.
- **Backfilled orphans** — `app_features.html`, `escalation_system.html`, `screens_reference.html` now have corresponding `.md` files so future edits go through markdown.
- **CI workflow** — `.github/workflows/docs.yml` regenerates and validates HTML on every PR.

Accuracy fixes

- `CLAUDE.md` — escalation corrected from 3-stage to 4-stage; the `Employee.role` field reference removed (role is inferred from `position`); region split between `africa-south1` and `eu-west1` documented.
- Role guides — escalation defaults corrected to 5 / 10 / 30 / 60 min with stages 3 and 4 disabled by default (previously documented as 2 / 7 / 30 / 60 with all enabled).
- `manager_guide.md` — Daily Review (web) added; previously undocumented.

Removed

- `migrate.html` — orphan build artifact at repo root, not linked anywhere.
-
